guided surgery kit catalog & manual
BioHorizons is committed to developing evidence-based and scientifically-proven products. This commitment started with the launch of the Maestro implant system in 1997 and remains in full force today with our most recent launches, the Tapered Plus, Tapered Tissue Level, and Tapered 3.0 implant systems.

The focus of BioHorizons on science, innovation and service enables our customers to confidently use our comprehensive portfolio of dental implants and biologics products making BioHorizons one of the fastest growing companies in the dental industry.

BioHorizons helps customers restore smiles in 85 markets throughout North America, Europe, South America, Asia, Africa, and Australia.

The BioHorizons guided surgery kit offers the precision and predictability of guided implant placement with a streamlined, single kit design. All components are color-coded to avoid the complexity seen with other systems while offering our customers predictable implant placement for optimal esthetic outcomes.

**Surgical guide flexibility**
Open architecture design for fabrication of surgical guides.

**Guided implant depth control**
Implant is placed to planned depth using a surgical guide created from a virtual treatment plan.

**Ease of use**
Master cylinders and instruments are color-coded to ensure proper component usage.
perfect fit for precise implant placement

The guided surgery kit can be used to place all diameters from 3.0mm to 5.8mm of the highly successful Tapered Internal, Tapered Plus, Tapered Tissue Level and Tapered 3.0 implants.*

- **patient specific**: the surgical protocol details the instrument sequence from site preparation to implant placement
- **clinical efficiency**: surgical instrument design and single kit layout avoids the complexity of other surgical kits
- **guided placement**: implant drivers seat the implants to proper depth through the master cylinder using depth stops
- **predictable placement**: precision fit and color-coding ensures accurate execution of the virtual treatment plan

* 3.4mm Tapered Internal instruments available late 2015. Sold separately.
GUIDED SURGERY PROCESS

Surgical Plan to Surgical Guide

1 Clinical step - CT scan appointment
Initial patient records and CT scan. CT scan protocols will vary depending on the guide manufacturer. Guide manufacturers details are available at guide.biohorizons.com

2 Clinical step - Treatment plan
Diagnose and treatment plan for guided surgery. Determine if adequate vertical space is available to accommodate the surgical guide and related components. Import CT scan data into the treatment planning software and design the case.

3 Guide manufacturer step - Guide fabrication
Guide manufacturer fabricates the surgical guide using the virtual treatment plan and BioHorizons master cylinders and pilot sleeves. A patient-specific surgical protocol is generated for the clinician to follow.

4 Clinical step - Guided surgery
Clinician performs the procedure using the surgical guide and the BioHorizons guided surgery kit while following the surgical protocol.

The surgical guide must be fabricated using BioHorizons manufactured master cylinders and pilot sleeves. Please contact your guide manufacturer for further information.
GUIDED SURGERY INSTRUMENTS

Guided Surgery Kit

CGS3000
Guided Surgery Kit (with instruments)
Includes the instrumentation required to place BioHorizons Tapered implants*

CGS2500
Guided Surgery Tray & Lid (without instruments)

features:
• versatile, removable, hinged lid
• easy to disassemble and assemble during cleaning
• spare slots for additional instrumentation
• single color-coded kit for placement of BioHorizons Tapered implants*

Individual Components

CGS-YTP
3.8mm CGS Tissue Punch

CGS-GTP
4.6mm CGS Tissue Punch

CGS-BTP
5.8mm CGS Tissue Punch

CGS-FP
CGS Fixation Pin
(3 included with kit)

130-000
Ratchet

135-351
.050" (1.25mm) Hex Driver

* Mount-free Tapered Internal, Tapered Plus, Tapered 3.0, Tapered Tissue Level.
3.4mm Tapered Internal instruments available late 2015. Sold separately.
GUIDED SURGERY INSTRUMENTS

Drills

Guided surgery drills with definitive depth stops follow the standard Tapered Internal drill sequence and come in four different lengths. The patient-specific surgical protocol that accompanies the surgical guide will indicate which drill length and widths to use.

Drill Guides

Drill guides are color-coded to match the master cylinders. Use the proper size drill guide with the corresponding drill diameter to sequentially widen the osteotomy. The text on the drill guide specifies the corresponding drill width.

Quick Connect Handles

Quick connect handles are used in combination with the drill guides. The handles can be assembled pre-operatively with the specified drill guides.

* 2.8mm instrumentation available late 2015. * 2.8mm instrumentation is only required to place the 3.4mm diameter implant; it is not needed for other sizes. Sold separately.

shop online at www.biohorizons.com
### Implant Drivers

Use the implant drivers to deliver the implants through the master cylinders for guided implant placement. Use the depth stops to seat the implants to the planned depth. Orient the implant hex using the driver dimples or text located on the shaft of the implant driver as a reference.

#### Tapered Internal Implant Drivers
- **CGS-PYIDHS** 3.8mm CGS Implant Driver
- **CGS-PGIDHS** 4.6mm CGS Implant Driver
- **CGS-PBIDHS** 5.8mm CGS Implant Driver

#### Tapered Plus Implant Drivers
- **CGS-TP3IDHS** 3.8mm CGS Implant Driver, 3.0mm Platform
- **CGS-PYGIDHS** 4.6mm CGS Implant Driver, 3.5mm Platform
- **CGS-PGBIDHS** 5.8mm CGS Implant Driver, 4.5mm Platform

---

### Depth Stops

#### CGS-DH
**CGS Depth Stop Handle**
Engages the implant driver to place the implant at the proper depth through the master cylinder.

#### CGS-DDS
**CGS Disposable Depth Stop**
Snaps onto the specified stop position pre-operatively for hands-free implant depth control.
ANCILLARY INSTRUMENTS (SOLD SEPARATELY)

Instrumentation for 3.4mm implant

The 2.8mm drills and drill guide allow for placement of the 3.4mm diameter implant.

2.8mm Width CGS Drills

- CGS-2817: 2.8 x 17mm CGS Drill
- CGS-2821: 2.8 x 21mm CGS Drill
- CGS-2824: 2.8 x 24mm CGS Drill
- CGS-2828: 2.8 x 28mm CGS Drill

Screw-retained Implant Drivers

Screw-retained implant drivers can be used as an alternative to handpiece drivers when vertical access is limited. Use the depth stops to seat the implants to the planned depth. Orient the implant hex using the driver dimples.

Tapered Internal Implant Drivers

- CGS-PYIDR: 3.8mm CGS Screw-retained Implant Driver
- CGS-PGIDR: 4.6mm CGS Screw-retained Implant Driver
- CGS-PBIDR: 5.8mm CGS Screw-retained Implant Driver

Tapered Plus Implant Drivers

- CGS-TP3IDR: 3.8mm CGS Screw-retained Implant Driver, 3.0mm Platform
- CGS-PYGIDR: 4.6mm CGS Screw-retained Implant Driver, 3.5mm Platform
- CGS-PGBIDR: 5.8mm CGS Screw-retained Implant Driver, 4.5mm Platform

Tapered Plus Implant Driver Markings

- Laser marking indicates prosthetic platform / body diameter
- Top band indicates prosthetic platform
- Bottom band indicates master cylinder

The Tapered Implant site dilators are used to create or enlarge osteotomies in soft maxillary bone. These instruments compress the bone laterally rather than removing valuable bone from the surgical site, creating a more dense bone-to-implant interface. The Tapered site dilators match the geometry of the Tapered Surgical Drills and can be used through the guide master cylinders.
BioHorizons implants can be delivered through the surgical guide. If attempting to use BioHorizons mounted implants, the 3inOne® abutment will have to be removed prior to implant delivery.

The 3.0 and 3.4mm implants use the 3.8mm master cylinder and drill guides. The guided implant placement of the 3.0 and 3.4mm implants will be properly controlled by using the 3.8/3.0 Tapered Plus implant driver.

*Laser-Lok 3.0 implant utilizes the same color coding as the Tapered 3.0.

†3.4mm Tapered Internal instrumentation will be available late 2015.

‡When placing 18mm length implants using the guided surgery kit, the drills will progress 0.54mm deeper than the final implant placement/depth.

Removal of the guide is necessary before placing Tapered Tissue Level implants, as the soft tissue collar will not fit through the master cylinder. The guided surgery protocol enables the osteotomy to be created to the correct depth, angulation and diameter.
This surgical manual serves as a reference for using the Guided Surgery Kit. It is intended solely to provide instructions on the use of BioHorizons products. It is not intended to describe the methods or procedures for diagnosis, treatment planning, or placement of implants, nor does it replace clinical training or a clinician’s best judgment regarding the needs of each patient. BioHorizons strongly recommends appropriate training as a prerequisite for the placement of implants and associated treatment.

The procedures illustrated and described within this manual reflect idealized patient presentations with adequate bone and soft tissue to accommodate implant placement. No attempt has been made to cover the wide range of actual patient conditions that may adversely affect surgical and prosthetic outcomes. Clinician judgment as related to any specific case must always supersede any recommendations made in this or any BioHorizons literature.

Before beginning any implant surgical procedure using the BioHorizons Guided Surgery Kit:

- Read and understand the Instructions for Use that accompany the products.
- Clean and sterilize the surgical tray and instruments following the Instructions for Use.
- Become thoroughly familiar with all the instruments and their uses.
- Study the surgical kit layout and iconography.
- Design a surgical treatment plan to satisfy the prosthetic requirements of the case.

**Indications**

The Guided Surgery Kit is intended to facilitate the creation of an osteotomy for placement of BioHorizons implants using a surgical guide that incorporates BioHorizons manufactured master cylinders. The bone cutting instruments are intended for use in the mandible or maxilla for partially and fully edentulous arches.
### Guided Surgery Kit Instructions

Prior to use, clean and sterilize the surgical tray and instruments according to the Instructions for Use included with the kit. Study the kit layout, color-coding and iconography. Surgical assistants should be thoroughly familiar with all instruments and their uses prior to initiating the surgical procedure.

The drill section includes drills with definitive stops at lengths of 17, 21, 24, and 28mm. Drills of 17mm and 21mm in length should be stored with the flutes up while the 24mm and 28mm drills should be stored with the flutes down.

The implant driver section includes drivers for BioHorizons Tapered implants.

The drill guide section includes the drill guides to be used with the drills for implant site preparation.

Quick connect handles are located under the tray insert.

Master Cylinders and Pilot Sleeves

Patient anatomy and the virtual treatment plan determine the master cylinder and/or pilot sleeve to be used in the surgical guide. Three different master cylinder diameters and one pilot sleeve are available.

Pilot sleeves can be used when interdental space is limited due to patient anatomy or if a collision between the master cylinders is anticipated.
GUIDED SURGERY PREPARATION

Pre-surgery preparation

Inspect the surgical guide for defects and potential weak areas. Visually evaluate the position of the master cylinder and/or pilot sleeve to ensure it is placed according to the treatment plan.

Ensure the thru hole of the drill guides, pilot sleeves, and master cylinders are free of debris.

The surgical guide must have a stable fit to the patient’s anatomy. If a stable fit cannot be obtained at time of surgery, the surgical guide should not be used. Do not use excessive force to seat the surgical guide.

Review the surgical plan and instruments within the kit prior to surgery. Drill use should be cross-checked against the drill usage chart (ML0226). Any drills that are worn, marked or dull should be replaced. Be conscious of the specified implant driver stop position (SP1 – SP4) if indicated.

Place the drill in the handpiece and check the fit with all the drill guides and pilot sleeves prior to surgery.

Quick Connect Handle

Assemble the quick connect handle. Insert the drill guide into the quick connect handle while depressing the end portion.

Firmly hold the quick connect handle or drill guide while progressing through the drill sequence.
GUIDED SURGERY PREPARATION

Drilling Technique

Fully seat the drill guide into the master cylinder prior to drilling.

- In cases where the patient has limited opening/interocclusal space, components may be stacked out of the mouth. Insert the drill in the handpiece and place through the appropriate drill guide. Then insert the assembly into the master cylinder, sliding the drill guide down into place (Figure 1). Ensure that the drill guide is evenly seated before initiating drilling (Figure 2).

Each drill should be advanced as far as possible through the drill guides and pilot sleeves prior to initiating drilling.

Use short, light strokes to progressively advance the drills to depth with minimal pressure on the drills. Profuse irrigation throughout the drilling sequence is necessary to provide lubrication and prevent overheating.

Use an in-and-out pumping action (Figure 3) to help clear flutes and drill guides of any bone debris. Drills should not be completely removed from drill guides or pilot sleeves during pumping. When finally removing drills from master cylinders and drill guides, the drill should not be rotating.

**Warning:** Failure to follow these steps can cause the drills to bind in the drill guides.

Pilot Guide Technique

When using a pilot sleeve, advance the 2.0mm pilot drill without a drill guide. Once the initial osteotomy has been drilled, remove the surgical guide and proceed with the manufacturer’s standard protocol for implant placement.
DRILL OVERVIEW

Drill Depth Stops

The drills include lengths of 17, 21, 24, and 28mm and the standard diameters for all BioHorizons Tapered implants. All drills included with this system are externally irrigated and require an intermittent drilling technique with steady sterile irrigation.

Drill lengths are line to line from drill tip to hub.

* only 17mm drills have depth markings, should they need to be used without the guide.

Important Considerations

- Peri-operative oral rinses with a 0.12% Chlorhexidine Digluconate solution have been shown to significantly lower the incidence of post-implantation infectious complications.² A pre-operative 30-second rinse is recommended, followed by twice daily rinses for two weeks following surgery.

- Drilling must be done under a constant stream of sterile irrigation. A pumping motion should be employed to prevent overheating the bone. Surgical drills should be replaced when they are worn, dull, corroded or in any way compromised. BioHorizons recommends replacing drills after 12 to 20 osteotomies.³ A Drill-usage Tracking Chart is available at biohorizons.com to record this important information.

- There is a risk of injury to the mandibular nerve associated with surgical drilling in posterior mandibular regions. To minimize the risk of nerve injury, it is imperative that the clinician understands the virtual treatment plan created and ensures the surgical guide corresponds to the clinician’s virtual treatment plan.
GUIDED SURGERY CASE EXAMPLE

Placing a 4.6mm x 10.5mm Tapered Internal Implant

A patient-specific surgical protocol is included with the surgical guide. The surgical protocol includes the recommended components to be used for each implant site. Verify the protocol corresponds to the submitted virtual treatment plan prior to surgery.

Clinician judgment must always supersede any recommendations in the surgical protocol and any BioHorizons Instructions for Use.

Sample Protocol for BioHorizons Guided Surgery Kit

| implant label | 29 |
| implant type | TLX610 |
| implant length | 10.5 |
| guide site | Composite |

| drill guide/drill | 2.0 |
| drill guide/drill | 2.5 |
| drill guide/drill | 3.2 |
| drill guide/drill | 3.7 |
| drill guide/drill | 4.1 |

| guided implant placement | SP2 |
| implant driver | 4.6 |

Clinician judgment, as related to individual patient presentations, must always supersede recommendations in any BioHorizons Instructions for Use (IFU). Additional technical information is available upon request from BioHorizons or may be viewed and/or downloaded at www.biohorizons.com.

Master Cylinder Position Reference

**BioHorizons products are available in over 85 markets worldwide • www.biohorizons.com**
GUIDED SURGERY CASE EXAMPLE

Implant Site Preparation

### 2.0 Pilot Drill and Drill Guide

- **Initiate osteotomy with pilot drill**
  - Select the 2.0 x 21mm drill
  - Place the 2.0mm drill guide in the 4.6mm master cylinder
  - Insert the drill in the drill guide and use short, light strokes to progressively advance the drills until the depth stop rests on the drill guide
  - Remove the 2.0mm drill guide

### Width Increasing Drills and Drill Guides

- **Incrementally widen the osteotomy**
  - Continue through the drill sequence using the specified drills and drill guides

shop online at www.biohorizons.com
GUIDED SURGERY CASE EXAMPLE

Mount-free Transfer

Vial caps are a surgical reference and are color-coded to indicate body diameter (3.0mm=white, 3.4mm=purple, 3.8mm=yellow, 4.6mm=green, 5.8mm=blue). Implant drivers are color-coded by prosthetic platform (3.0mm=gray, 3.5mm=yellow, 4.5mm=green, 5.7mm=blue) for proper mating with the implant connection.

Engage the implant with the PEEK snap ring of the implant driver that matches the prosthetic platform. The hex of the driver has no retentive feature and does not need to be engaged. The driver hex will automatically engage the implant in the osteotomy as the driver is slowly rotated using apical pressure.

The cover cap for a two-stage surgical protocol is mounted in the vial cap.

Depth Stop Positions

Implant drivers include four stop positions for the depth stops to engage. Reference the patient-specific surgical protocol for the required stop position. Visual depth control can be used as an alternative to using the depth stops.

The laser-marked band above SP2 is used as a visual indicator to assist in delineating the four stop positions.

The depth stop handle or disposable depth stops can be used for guided implant depth control.

Disposable depth stops are for single use only.

**Guided Implant Delivery**

A handpiece or ratchet can be used to place a BioHorizons guided implant through the master cylinder. If a BioHorizons guided implant is not being used and a pilot sleeve is being used, the surgical guide should be removed to deliver the implant using the conventional implant placement protocol.

**Implant Placement**

Place the implant through the master cylinder

- Using the depth stop, engage the implant driver at the SP2 position
- Ensure the shaft of the implant driver is properly aligned with the master cylinder
- Place the 4.6 x 10.5mm implant through the master cylinder

**Implant depth control**

- Depth placement of the implant is controlled by the depth stop engaging the indicated stop position
- The depth stop handle or disposable depth stop should firmly rest on top of the master cylinder

**Handpiece Driver Hex Orientation**

Orienting the hex when using a handpiece

When seating the implant with a handpiece, use the corresponding dimples on the driver to orient one internal hex flat perpendicular to the implant angulation plane.

Orienting the hex when using a ratchet

When seating the implant with a ratchet, use the text on the shaft of the driver to orient one internal hex flat perpendicular to the implant angulation plane.
A period of unloaded healing time is often recommended to allow for integration between the bone and implant surface. This is dependent on individual patient healing rates and bone quality of the implant site. Each case must be independently evaluated. See the implant Instructions for Use for more information.

The patient should be instructed to follow a post-surgical regimen including cold packs for 24 hours post-implantation. The patient’s diet should consist of soft foods and possibly dietary supplements. Pharmacological therapy should be considered as the patient’s condition dictates.

If a removable prosthesis is used during the initial healing phase, a soft liner material should be used to prevent pressure on the surgical site. Relieve the prosthesis over the implant site prior to the soft liner application. Periodically check the patient’s soft tissue and bone healing using clinical and radiographic evaluations.

Ongoing hygiene for the implant patient is vital. Hygiene recall appointments at three month intervals are suggested. Instruments designed for implant abutment scaling, such as Implacare® instruments from Hu-Friedy® should be utilized. The stainless steel handles may be fitted with assorted tip designs for hygiene on natural teeth. The Implacare® scalers contain no glass or graphite fillers that can scratch implant abutments.

Orient the hex when using a ratchet, hand wrench or handpiece

When seating the implant with a ratchet, use the corresponding dimples on the driver to orient one internal hex flat perpendicular to the implant angulation plane.

Post-operative Instructions

GUIDED SURGERY CASE EXAMPLE

Screw-Retained Driver Hex Orientation
Symbol Descriptions for Product Labeling

1. Implant success rate is the weighted average of all published human studies on BioHorizons implants. These studies are available for review in BioHorizons document numbers ML0606 and ML0130.

2. The influence of 0.12 percent chlorhexidine digluconate rinses on the incidence of infectious complications and implant success.

3. Heat production by 3 implant drill systems after repeated drilling and sterilization.

BioHorizons Lifetime Warranty on Implants and Prosthetics: All BioHorizons implants and prosthetic components include a Lifetime Warranty. BioHorizons implant or prosthetic components will be replaced if removal of that product is due to failure (excluding normal wear to overdenture attachments).

Additional Warranties: BioHorizons warranties instruments, surgical drills, taps, torque wrenches and Virtual Implant Placement (VIP) treatment planning software.

(1) Surgical Drills and Taps: Surgical drills and taps include a warranty period of ninety (90) days from the date of initial invoice. Surgical instruments should be replaced when they become worn, dull, corroded or in any way compromised. Surgical drills should be replaced after 12 to 20 osteotomies.3

(2) Instruments: The BioHorizons manufactured instrument warranty extends for a period of one (1) year from the date of initial invoice. Instruments include drivers, sinus lift components, implant site dilators and BioHorizons tools used in the placement or restoration of BioHorizons implants.

(3) VIP treatment planning software: VIP treatment planning software warranty extends for a period of ninety (90) days from the date of initial invoice. The warranty requires that VIP be used according to the minimum system requirements.

(4) Compu-Guide surgical templates: Compu-Guide surgical templates are distributed without making any modifications to the submitted Compu-Guide Prescription Form and VIP treatment plan (“as is”). BioHorizons does not make any warranties expressed or implied as it relates to surgical templates.

Return Policy: Product returns require a Return Authorization Form, which can be acquired by contacting Customer Care. The completed Return Authorization Form should be included with the returned product. For more information, please see the reverse side of the invoice that was shipped with the product.

Disclaimer of Liability: BioHorizons products may only be used in conjunction with the associated original components and instruments according to the Instructions for Use (IFU). Use of any non-BioHorizons products in conjunction with BioHorizons products will void any warranty or any other obligation, expressed or implied.

Treatment planning and clinical application of BioHorizons products are the responsibility of each individual clinician. BioHorizons strongly recommends completion of postgraduate dental implant education and adherence to the IFU that accompanies each product. BioHorizons is not responsible for incidental or consequential damages or liability relating to use of our products alone or in combination with other products other than replacement or repair under our warranties.

Compu-Guide surgical templates are ordered under the control of a Clinician. The Clinician recognizes responsibility for use. Therefore, regardless of the real or proven damages, the liability to BioHorizons is limited to the price of the product directly related to the reason for the claim.

Distributed Products: For information on the manufacturer’s warranty of distributed products, please refer to their product packaging. Distributed products are subject to price change without notice.

Validity: Upon its release, this literature supersedes all previously published versions.

Availability: Not all products shown or described in this literature are available in all countries. BioHorizons continually strives to improve its products and therefore reserves the right to improve, modify, change specifications or discontinue products at any time.

Any images depicted in this literature are not to scale, nor are all products depicted. Product descriptions have been modified for presentation purposes. For complete product descriptions and additional information, visit shop.biohorizons.com.
